# **1. INTRODUCTION**

## **1.1 Project Overview**

One of the most underrepresented demographic of people in our country are differently abled people. The technology to assist them is developing fast but no significant products have been developed that will be beneficial to them. Communications between deaf-mute and a normal person has always been a challenging task. It is complicated for mute people to communicate with able people unless they're trained in sign language. Quick communication in emergency situations is especially challenging. The human hand has remained a popular choice to convey information in situations where other forms like speech cannot be used. Voice Conversion System with Hand Gesture Recognition and translation will be handy to have a proper conversation between a normal person and an impaired person in any language.

This project aims to develop a system that converts the sign language into a human hearing voice in the desired language to convey a message to normal people, as well as convert speech into understandable sign language for the deaf and dumb. We are using a convolution neural network to create a model that is trained on different hand gestures. An app is built which uses this model. This app enables deaf and dumb people to convey their information using signs which get converted to human-understandable language and speech is given as output.

## **1.2 Purpose**

One of the most underrepresented demographic of people in our country are differently abled people. The technology to assist them is developing fast but no significant products have been developed that will be beneficial to them. Communications between deaf-mute and a normal person has always been a challenging task. It is complicated for mute people to communicate with able people unless they're trained in sign language. Quick communication in emergency situations is especially challenging. The human hand has remained a popular choice to convey information in situations where other forms like speech cannot be used. Voice Conversion System with Hand Gesture Recognition and translation will be beneficial to have a proper conversation between a normal person and an impaired person in any language.

## 2. LITERATURE SURVEY

### 2.1 Existing problem

One of the foundations of human civilization is communication. However, substantial sections of society are not equipped with the ability to communicate easily with others. Millions of people worldwide suffer from varying degrees of hearing loss, speech impairment, or both. Sign Language is a powerful tool to help overcome these disabilities and bridge the gap between hearing and differently-abled people. There are many sign language standards across the world and with the advancement in AI and machine learning, many sign language recognition models have been deployed for a vision-based approach to detect and translate sign language into text, speech, and other formats.

### 2.2 References

#### [1]Indian Sign Language Recognition using Deep Learning

P. Mistry, V. Jotaniya, P. Patel, N. Patel and M. Hasan,

*2021 International Conference on Artificial Intelligence and Machine Vision (AIMV), 2021, IEEE*

This paper provides a method of translation from Indian sign language to English words through deep learning models constructed using Convolutional Models and Sequence Models. The goal is to interpret a sign which is recorded through a video camera and sampled into sequences of images. This sequence is then passed through a deep learning model which passes an output vector with the highest value corresponding to the word.

The dataset is divided into training and testing purposes. The training dataset has seven different signs (Days of week-Monday, Tuesday, Wednesday, Thursday, Friday, Saturday and Sunday) The videos corresponding to these signs were recorded and sampled by extracting the frame sequence and developing around 50 sample sequences per word. Image augmentation was done which performed image translation, rotation, and scale to these images and increased its sample size further to about 1500 samples per word making it a 10500 sample size training dataset. Convolutional Neural Network (CNN) has been used for extracting features from images and Long

Short Term Memory (LSTM) for analyzing the sequence of these features. The model converged to the training dataset and achieved an accuracy of 99.98%.

## **[2]Indian Sign Language Recognition using Deep Learning**

K. Bantupalli and Y. Xie

*2018 IEEE International Conference on Big Data (Big Data), IEEE*

The paper presents a vision-based application that offers sign language translation to text thus aiding communication between signers and non-signers. The proposed model takes video sequences and extracts temporal and spatial features from them. Inception, a CNN (Convolutional Neural Network) model, is used for recognizing spatial features. An RNN (Recurrent Neural Network) is then used to train on temporal features. The gesture segments identified and processed by the CNN are classified by LSTM into one of the gesture classes using sequence data.

The dataset used is the American Sign Language Dataset. Each sign was performed five times by a single signer in varying lighting conditions and speed of signing. Each video was broken down by frame to images and then augmented to increase the data set for each sign to 2400 images. The CNN and RNN models were trained independently. The models yielded 90-93% accuracy depending upon the specifics of the architecture.

One of the problems the model faced is with facial features and skin tones. The model also suffered from loss of accuracy with the inclusion of faces, as faces of signers vary and performed poorly when there was variation in clothing.

## **[3]Bengali Sign Language Recognition Using Deep Convolutional Neural Network**

M. A. Hossen, A. Govindaiah, S. Sultana and A. Bhuiyan

*2018 Joint 7th International Conference on Informatics, Electronics & Vision (ICIEV) and 2018 2nd International Conference on Imaging, Vision & Pattern Recognition (icIVPR), IEEE*

In this paper, a new method for Bengali Sign Language Recognition using Deep Convolutional Neural Networks (DCNN) is proposed. The method is built to recognize static hand signs of 37 letters of the Bengali alphabet. The dataset comprises 37 hand signs (total 1147 images), in which each sign class includes 31 images taken at varying distances, orientation and intensity levels. The images represent the signs of the Bengali Language Alphabet as illustrated in the Bengali Sign Language Dictionary.

The images were augmented through many random transformations. Using the concept of transfer learning and fine-tuning, the VGG16 network was pre-trained. The pre-trained network is run on the dataset one time to extract the features necessary for the classification. Hence with the use of deep convolutional neural network and utilizing the learned features from a pre-trained network and fine-tuning the top layers of this network, a high overall recognition rate of 96.33% on the training dataset and 84.68% on the validation dataset have been achieved. This work has however used a very small dataset.

### **2.3 Problem Statement Definition**

Problems Faced:

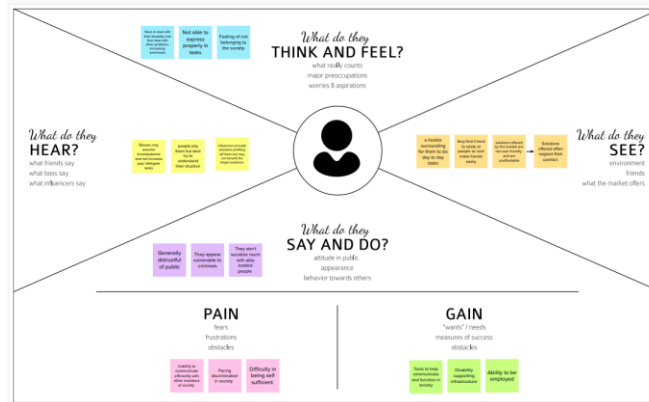

- Only specially abled people are taught sign language and the common person is unaware its working causing a communication gap.
- Under emergency situations, it is even more difficult for specially abled people to get help.
- Non-Emergency normal environments can also be hard for them to navigate needing special assistance.

Our solution:

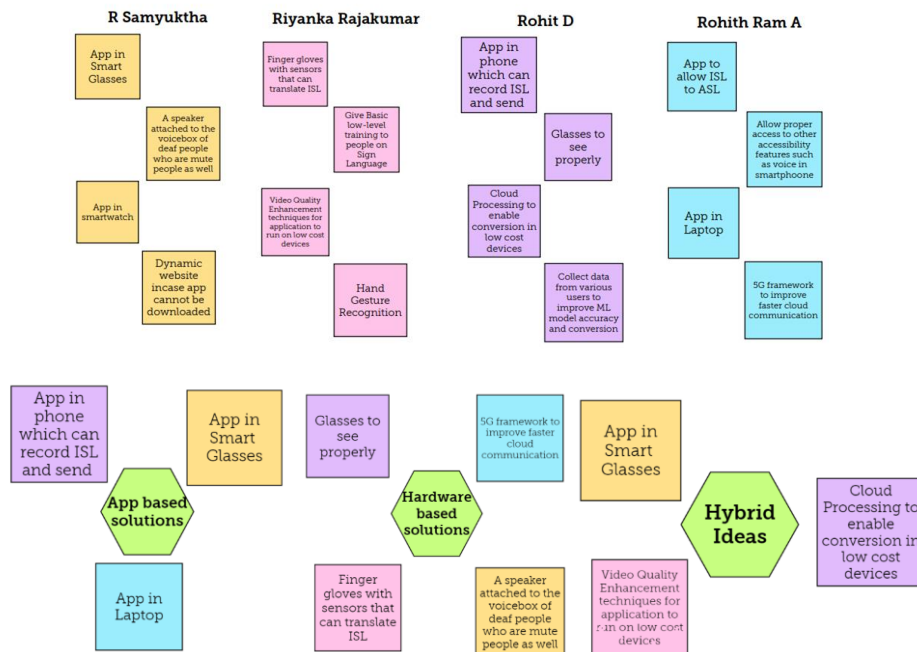

- 1. To build a system which converts sign language to speech and vice versa.
- 2. Make Use of various CNN models such as Inception and RNN to learn the conversion.
- 3. Convert various sign languages such as ASL and ISL.
- 4. Enable multi language conversion such as Tamil and Hindi.
- 5. Host in cloud to enable running on low cost mobile phones with low processing power.

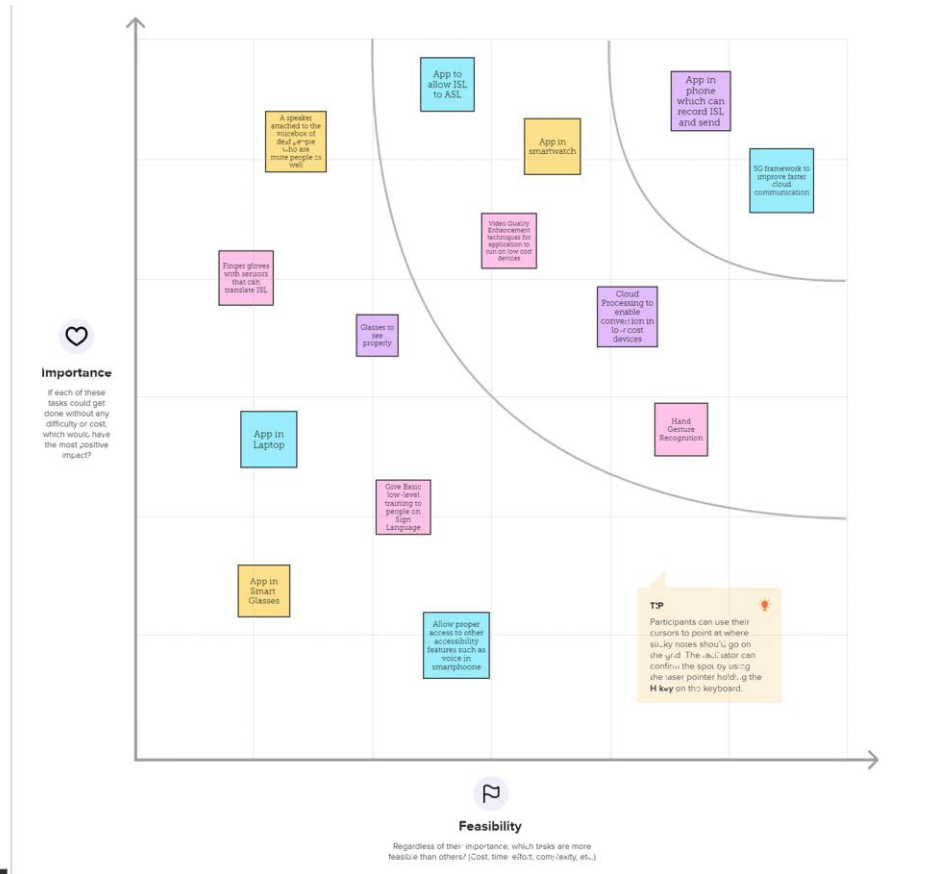

### 3. IDEATION & PROPOSED SOLUTION

#### 3.1 Empathy Map Canvas

#### 3.2 Ideation & Brainstorming

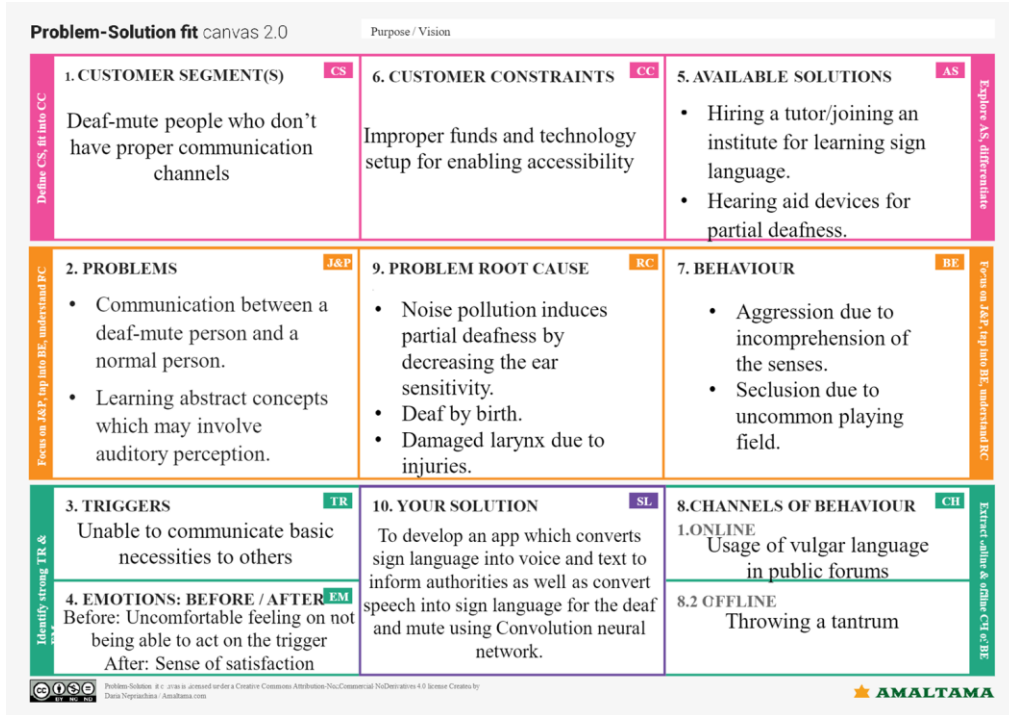

### 3.3 Proposed Solution

To facilitate communication between a differently abled person and a normal person during emergency situations our solution aims to develop an application which converts sign language into a human voice in the desired language as well as convert speech into understandable sign language for the deaf and dumb using Convolution neural network. The model makes use of a variation of CCN model called U-net. The application converts the (ISL) Indian Sign Language to text and sending it to the necessary authorities during emergency situations.

### 3.4 Problem Solution fit

## 4. REQUIREMENT ANALYSIS

### 4.1 Functional requirement

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User download App	IOS/PlayStore/Website
FR-2	User Registration in app	Registration through mobile number Registration through Gmail Registration through Facebook/Google Account
FR-3	User Confirmation	Confirmation via Username/Password Confirmation via OTP in Gmail/SMS
FR-4	User Login	Auto Login using Cache Login using OTP Login using Account/Google Account
FR-5	User Preferences	Enable Normal/Emergency Communication ISL/ASL Conversion Sign language to various Text Language Conversion Enable Data Sharing to improve conversion accuracies

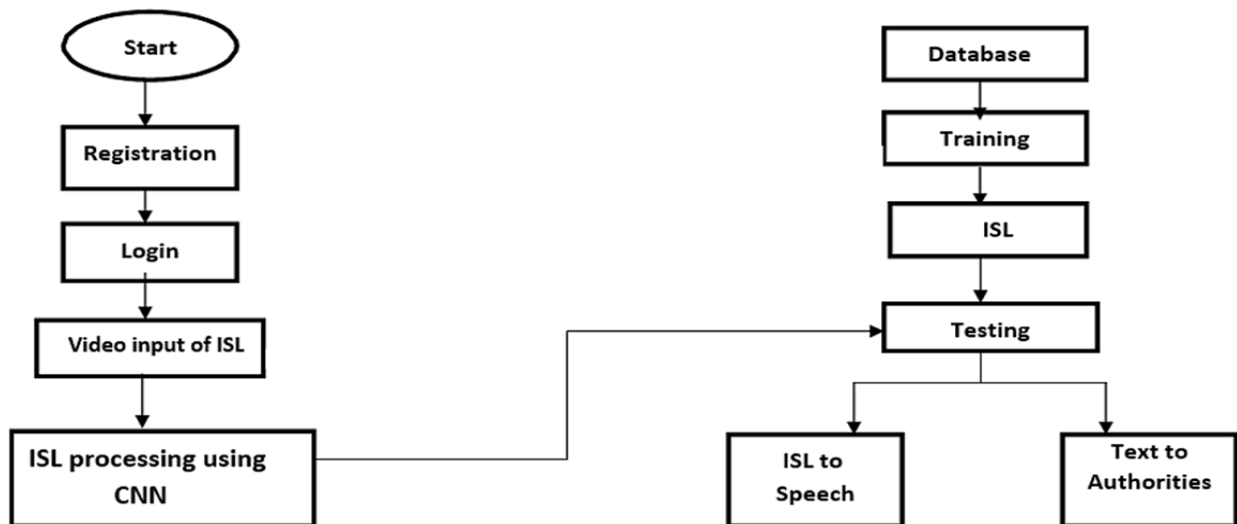

## 4.2 Non-Functional requirements

Following are the non-functional requirements of the proposed solution.

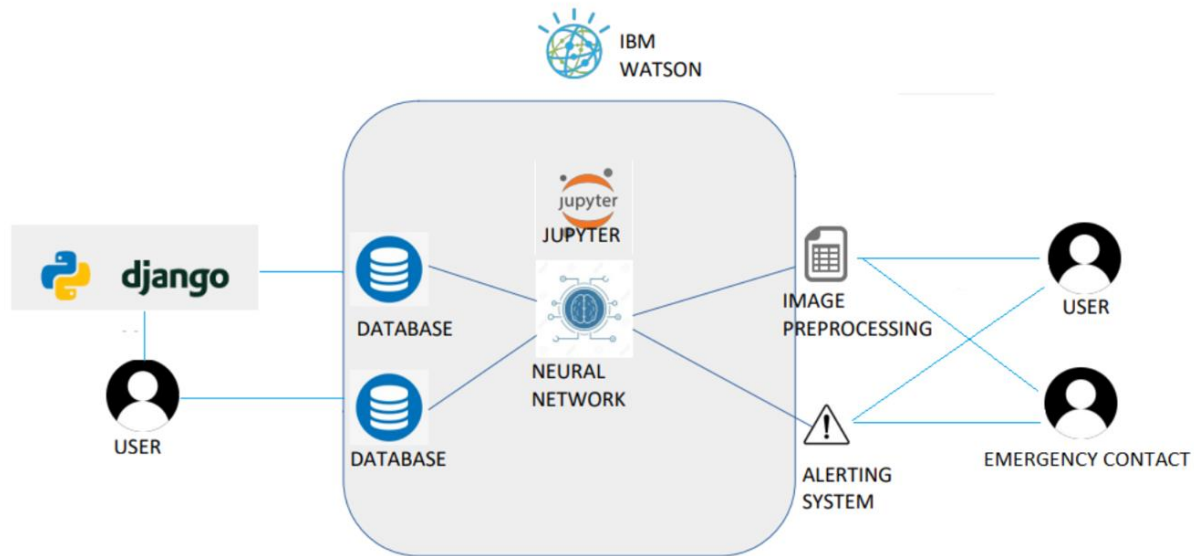

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	Ease of communication for differently abled people during emergency
NFR-2	Security	User decides to share/delete their videos and personal data
NFR-3	Reliability	Guaranteed and Precise sharing of information to the concerned authorities
NFR-4	Performance	Fast and effective conversion and sharing of information
NFR-5	Availability	User Friendly UI Available to users in various Operating Systems
NFR-6	Scalability	Multilingual conversion targets wider audience Can run on various Devices

## 5. PROJECT DESIGN

### 5.1 Data Flow Diagrams

## 5.2 Solution & Technical Architecture

## 5.3 User Stories

### User Stories

Use the below template to list all the user stories for the product.

User Type	Functional Requirement (Epic)	User Story Number	User Story i Task	Acceptance criteria	Priority	Release
Customer (Mobile user)	Registration	USN-1	As a user, I can register for the application by entering my mobile number	I can register and access my account	High	Sprint-1
		USN-2	As a user, I can register for the application through my gmail.	I can register and access my account	High	Sprint-1
		USN-3	As a user, I can register for the application through facebook/google account.	I can register and access my account	Low	Sprint-2
		USN-4	As a user, I can register for the application through Gmail	I can register and access my account	Medium	Sprint-2
	Confirmation	USN-5	As a user, I can receive a confirmation via OTP in gmail/SMS	I can receive confirmation via OTP	High	Sprint-1
		USN-6	As a user, I can receive confirmation by username and password.	I can receive confirmation via username and password	Low	Sprint-2
	Login	USN-7	As a user I can auto login using cache		Medium	Sprint-2
		USN-8	As a user I can login using OTP		Low	Sprint-2
		USN-9	As a user I can login using my google account or the account created for the application.		High	Sprint-1
	User preferences	USN-10	As a user I can enable normal/emergency communication depending upon the need which rises		High	Sprint-1
		USN-11	As a user I can choose ASL/iSL conversion		Low	Sprint-2
		USN-12	As a user I can convert sign language to various texts		High	Sprint-1
		USN-13	As a user, I can enable data sharing to improve conversion accuracies.		Low	Sprint-2

## 6. PROJECT PLANNING & SCHEDULING

### 6.1 Sprint Planning & Estimation

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-1	Datasets and preprocessing	USN-1	Creating and segregating the datasets into testing and training	2	Low	Riyanka Rajakumar
Sprint-1		USN-2	Importing the Imagetadatagenerator library and configuring it for image preprocessing	3	Medium	Rohit D
Sprint-1		USN-3	Applying the ImageDataGenerator functionality to train and test the data.	3	Medium	Rohit D
Sprint-2	Model Building (training and testing)	USN-4	Initializing the model	2	Low	Samyuktha R
Sprint-2		USN-5	Adding the convolution layer	3	Medium	Rohith Ram A
Sprint-2		USN-6	Adding the pooling layer	3	Medium	Rohit D
Sprint-2		USN-7	Adding the flatten layer	3	Medium	Rohith Ram A
Sprint-2		USN-8	Adding the dense layer	3	Medium	Riyanka Rajakumar
Sprint-2		USN-9	Compiling the model	2	Low	Samyuktha R
Sprint-2		USN-10	Fit and saving the model	2	Low	Riyanka Rajakumar
Sprint-2		USN-11	Testing the model	3	Medium	Rohith Ram A

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-3	Flask application	USN-12	Building the HTML page	5	Very High	Samyuktha R
Sprint-3		USN-13	Running the flask application	5	Very High	Rohith Ram A
Sprint-4	Deploying the model on IBM Cloud	USN-14	Register for IBM Cloud	2	Low	Riyanka Rajakumar
Sprint-4		USN-15	Training the image classification model	4	High	Samyuktha R
Sprint -4		USN-16	Deployment of application on IBM Cloud	5	Very High	Rohit D

### 6.2 Sprint Delivery Schedule

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	8	4 Days	22 Oct 2022	26 Oct 2022	20	26 Oct 2022
Sprint-2	21	6 Days	27 Oct 2022	02 Nov 2022	21	02 Nov 2022
Sprint-3	10	6 Days	04 Nov 2022	10 Nov 2022	10	10 Nov 2022
Sprint-4	11	5 Days	12 Nov 2022	17 Nov 2022	11	17 Nov 2022

### 6.3 Reports from JIRA

## 7. CODING & SOLUTIONING (Explain the features added in the project along with code)

### 7.1 Feature 1

Image Segmentation is the process by which a digital image is partitioned into various subgroups (of pixels) called Image Objects, which can reduce the complexity of the image, and thus analysing the image becomes simpler. Assignment of labels to pixels is done and the pixels with the same label fall under a category where they have some or the other thing common in them.

Image segmentation performs localisation and classification. Localization means finding the location (pixels) of a particular object within a much larger image. Classification means to classify the object that has been localized within the image.

U-Net is a convolutional neural network that was developed for image segmentation. The network is based on a fully convolutional network whose architecture was modified and extended to work with fewer training images and yield fast and precise segmentation.

Architecture:

U-net architecture is symmetric and consists of two major parts:

- The left part is called the contracting path which classifies the object, constituted by the general convolutional process.
- The right part is an expansive path which localizes the object, constituted by transposed 2D convolutional layers.

Each blue box corresponds to a multi-channel feature map. The number of channels is denoted on top of the box. The x-y-size is provided at the lower left edge of the box. White boxes represent copied feature maps. The arrows denote the different operations.

The image is input at the beginning of the network (left-top). The data is then propagated through all possible paths and, in the end, the segmentation map comes out. The main idea is to supplement a usual contracting network by successive layers, where upsampling operators replace pooling operations.

The contracting path follows the typical architecture of a convolutional network. It consists of the repeated application of two 3x3 convolutions (unpadded convolutions), each followed by a rectified linear unit (ReLU) and a 2x2 max pooling operation with stride 2 for downsampling.

At each downsampling step the number of feature channels are doubled.

Every step in the expansive path consists of an up-sampling of the feature map followed by a 2x2 convolution (“up-convolution”) that halves the number of feature channels, a concatenation with the correspondingly cropped feature map from the contracting path, and two 3x3 convolutions, each followed by a ReLU.

The cropping is necessary due to the loss of border pixels in every convolution. At the final layer a 1x1 convolution is used to map each 64-component feature vector to the desired number of classes.

In total the network has 23 convolutional layers.

Hence these layers increase the resolution of the output.

Features of U-net:

- U-Net learns segmentation in an end-to-end setting.  
You input a raw image and get a segmentation map as the output.
- U-Net is able to localize precisely and distinguish borders.  
Performs classification on every pixel so that the input and output share the same size.
- U-Net uses limited annotated images.  
Data augmentation with elastic deformations reduces the number of annotated images required for training.

## 7.2 Feature 2

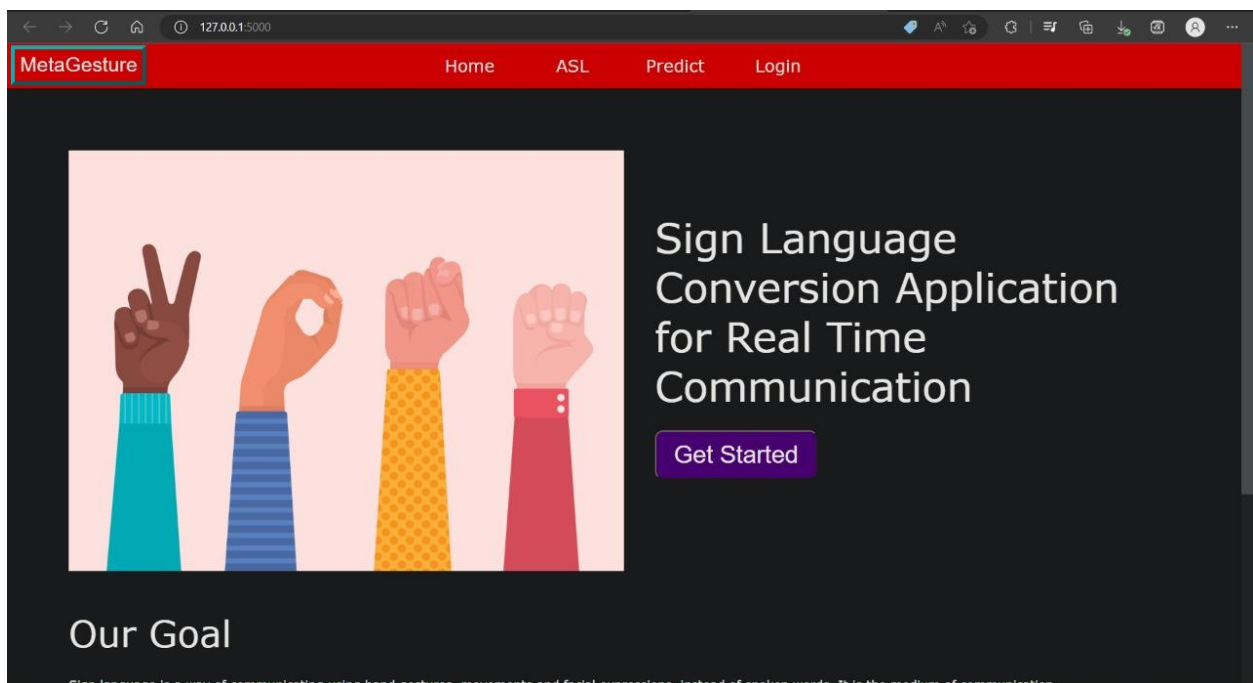

The model contains a FLASK Application completed with login and registration forms to allow the specially abled persons to have an overall experience. Using frameworks like OpenCV and Keras it was possible to include real time prediction of sign language using the builtin camera of the device the website is running on.

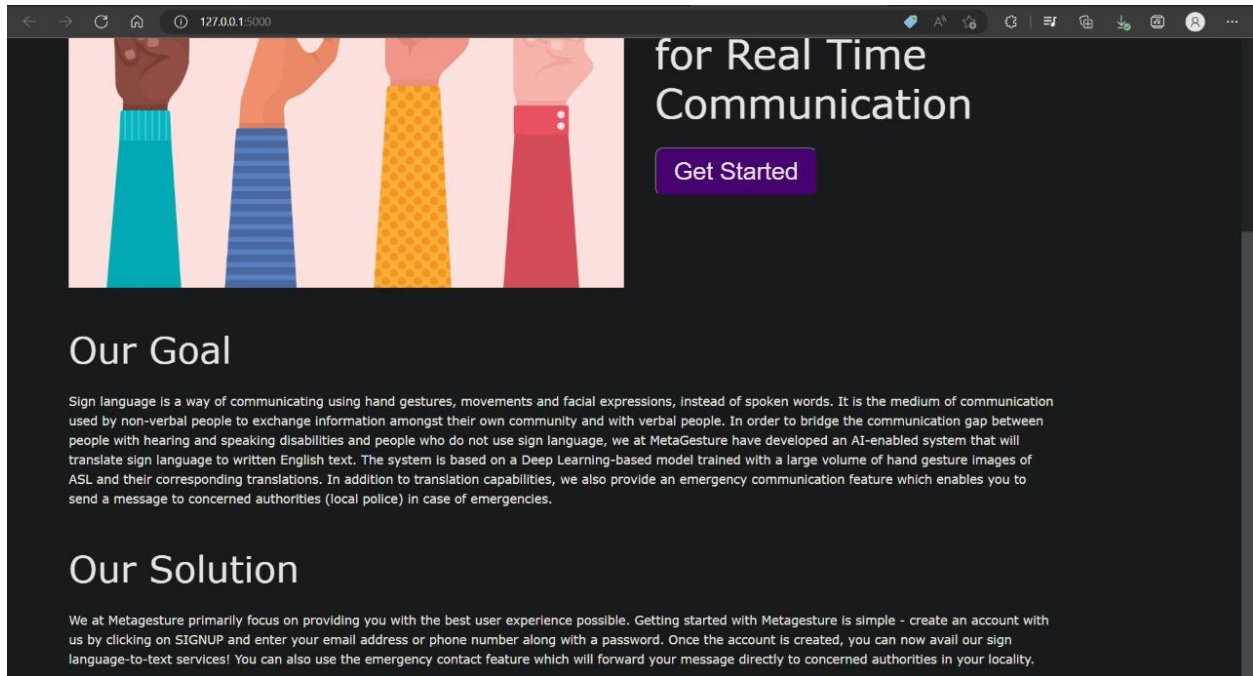

The signing facility allows for personalization of the model and helps improves the overall experience, but the prediction facility can be used without the need to sign in. This improves privacy of the users

The main features of the application are listed below:

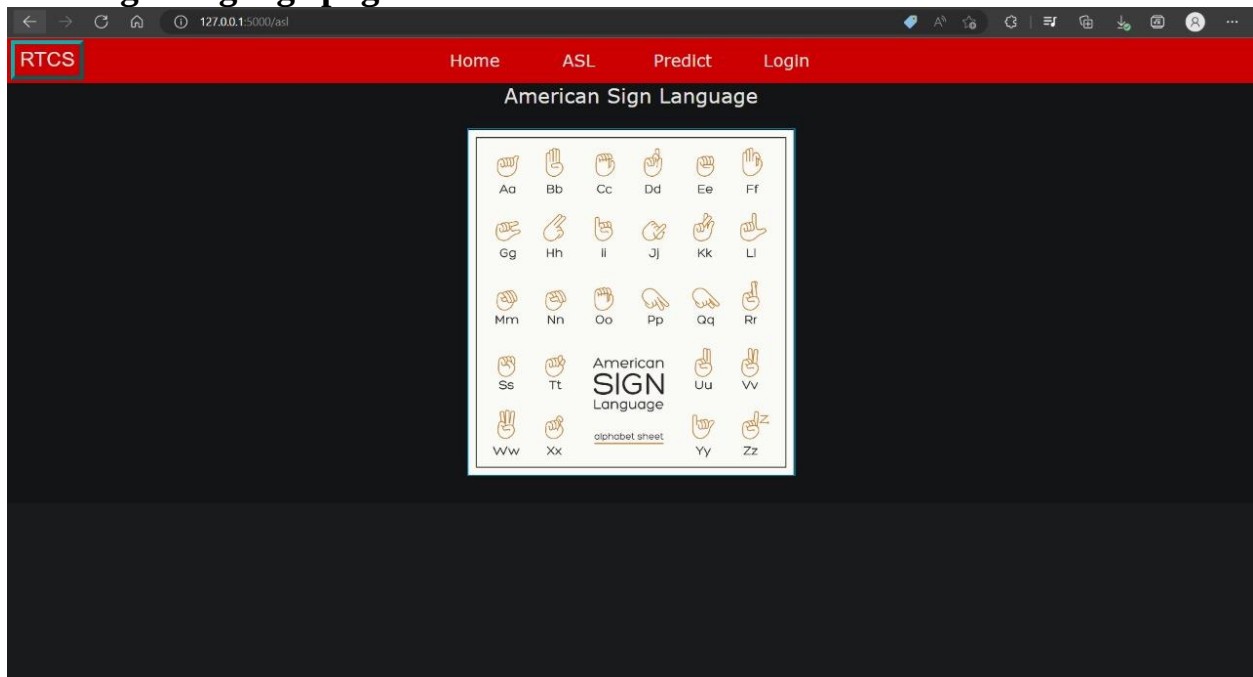

- Real time prediction of sign language and natural interpretation.
- An account management system.
- Supports American Sign Language.
- Works across all platforms and devices which support web browsing.
- No signing required - predictions.

### Home page:

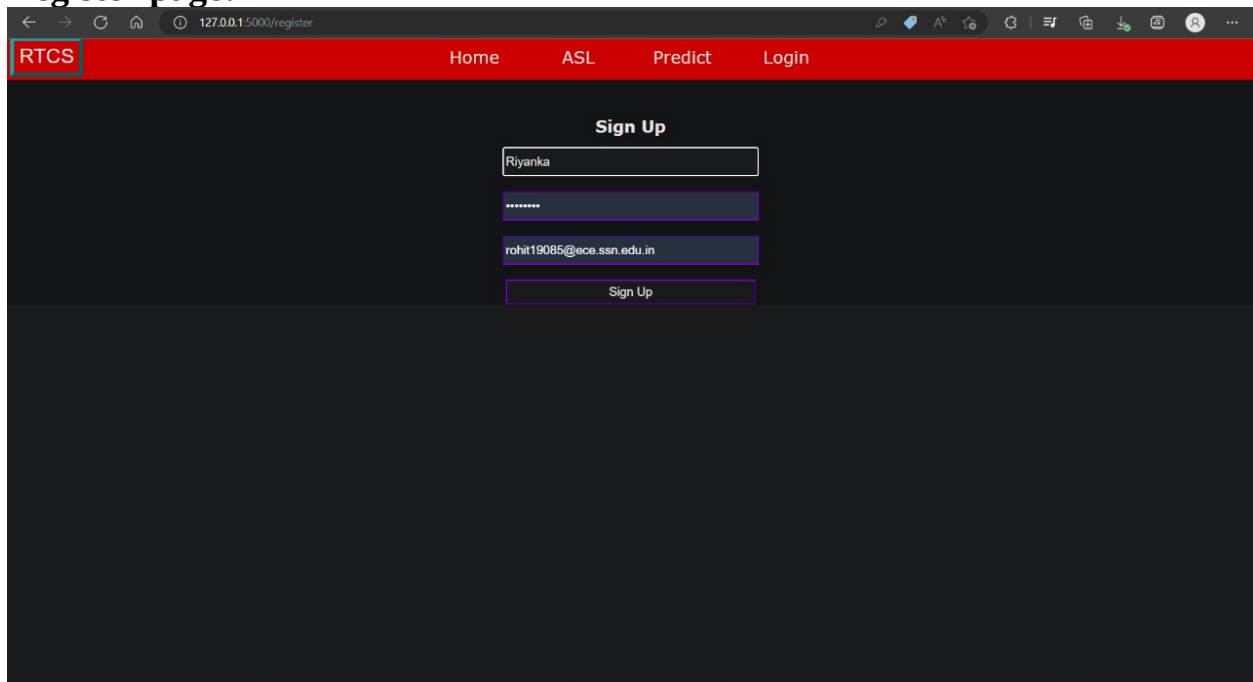

## ASL Sign language page:

## Register page:

A screenshot of a web browser showing a registration page. The browser's address bar displays '127.0.0.1:5000/register'. The page has a red header with the 'RTCS' logo on the left and navigation links 'Home', 'ASL', 'Predict', and 'Login' on the right. The main content area is dark gray and features a 'Sign Up' form. The form includes four input fields: a name field containing 'Riyanka', a password field with masked characters, an email field containing 'rohit19085@ece.ssn.edu.in', and a 'Sign Up' button.

## 8. TESTING

### 8.1 Testing the Model

```
In [41]: path="C:/Users/riyan/Downloads/conversation engine for deaf and dumb (1)/Dataset/test_set/H/20.png"
img=load_img(path,target_size=(100,100))
img

Out[41]: 
```

```
In [35]: arr= img_to_array(img)
frame=cv2.imread(path)
data=detect(frame)

1/1 [=====] - 0s 180ms/step
THE PREDICTED LETTER IS  H
```

```
In [42]: path="C:/Users/riyan/Downloads/conversation engine for deaf and dumb (1)/Dataset/test_set/B/2.png"
img=load_img(path,target_size=(100,100))
img

Out[42]: 
```

```
In [39]: rr= img_to_array(img)
frame=cv2.imread(path)
data=detect(frame)

1/1 [=====] - 0s 21ms/step
THE PREDICTED LETTER IS  B
```

### 8.2 Test Cases

S. No.	Test Scenarios
1.	Verify if user can see the login popup whenever he/she clicks on the login button.
2.	Verify if user is able to log into the application with invalid credentials.
3.	Verify if the user is able to see video feed in predict page
4.	Verify if the user is able to see predicted alphabet generated.
5.	Verify if the user can login again after logging out of the application successfully.
6.	Verify the UI in the register page of the application.
7.	Verify user information is stored in database for further communications.
8.	Verify the UI elements in the register page of the application.

### 8.3 User Acceptance Testing

Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal

## 10. ADVANTAGES & DISADVANTAGES

### Advantages:

- Easy to use.
- Fills the communication gap between the specially abled person and a normal person.
- Useful in emergency situations

### Disadvantages:

- Will take a while to get accustomed in navigating the application.
- Will need active and proper internet connection

## **11. CONCLUSION**

We have developed a system that converts the sign language into text in the desired language to convey a message to normal people, as well as text to understandable sign language for the deaf and dumb. We have made use of a variation of convolution neural network model called U-net to create a model that is trained on different hand gestures. An app is built which uses this model. This app enables deaf and dumb people to convey their information using signs which get converted to texts which can be sent to the authorities to get timely help.

## **12. FUTURE SCOPE**

Since we have used ASL in this project we can further extend this project using Indian Sign languages also. Conversion of sign language to all the regional languages of India can be implemented. We can introduce communities in the app and help deaf-mute people from across the world to interact and learn other sign languages from each other. Emergency contact provision can be extended to be able to contact local ambulance, fire station etc.
